Reference: EE/CA for the 105-B Reactor Facility

EDMC

I first came to Hanford in 1971 to work at the N Reactor. B Reactor was, at that time a revered monument to what technology and dedication could achieve. It remains that today.

It is sad that all of the auxiliary facilities have been removed but I believe there is still enough structure for future generations to see and understand the magnitude of what was achieved there. I strongly urge that **ALTERNATIVE THREE – HAZARDS MITIGATION FOR PUBLIC ACCESS** be accepted and the reactor preserved so that future generations can glimpse what was achieve in a remote desert to try to save the world from tyranny.

Thank you for the opportunity for input on this most interesting and often forgotten national landmark.

Sincerely,

Linda Munson
